

Business Problem Statement

Tata Motors Sales Performance Analysis

Background

Tata Motors generates large volumes of transactional sales data across customers, vehicles, dealer cities, payment modes and fuel types. Raw data alone does not provide actionable insights for management.

Business Problem

Management requires a centralized dashboard to monitor revenue, sales performance, product performance, customer behavior and regional trends for informed decision-making.

Objectives

- Analyze sales performance.
- Track KPIs.
- Identify top-performing models and cities.
- Monitor monthly revenue trends.
- Understand payment and fuel preferences.

Scope

The dashboard covers executive KPIs, revenue trends, model performance, dealer city analysis, payment mode analysis and fuel type analysis using Power BI connected to a MySQL database.

Expected Outcome

An interactive dashboard enabling stakeholders to monitor performance, identify opportunities and support strategic decisions through data-driven insights.
